

1 Motion, forces and energy

1.1 Physical quantities and measurement techniques

Scalar: Physical quantities that require only **magnitude** for complete description.

Examples: distance, speed, time, mass, energy and temperature

Vector: Physical quantities that require both **magnitude** and **direction** for complete description.

Examples: displacement, force, weight, velocity, acceleration, momentum, electric field strength and gravitational field strength

1.2 Motion

Speed: Distance travelled per unit time.

Velocity: Rate of change of displacement (or) change in displacement per unit time

Formula: **speed = distance / time**

$$v = s / t$$

Unit: m/s or km/hr

Average Speed: average speed = total distance travelled ÷ total time taken

Acceleration: Rate of change of velocity (or) change in velocity per unit time

Formula: acceleration = change in velocity / time taken

$$a = \Delta v / \Delta t$$

(or)
$$a = (v - u) / t$$

Unit: m / s^2

Uniform acceleration: uniform change in velocity per unit time

Non-uniform acceleration: Non-uniform change in velocity per unit time.

Deceleration/Retardation/Negative Acceleration: If the velocity of an object **decreases**, it is undergoing deceleration or retardation or negative acceleration

Positive velocity: object moving forward or in positive direction is said to have positive velocity

Negative velocity: object moving backward/reverse or in negative or opposite direction is said to have negative velocity

Free fall acceleration: acceleration of free fall g for an object near to the surface of the Earth is approximately constant and is approximately **$9.8 m / s^2$**

1.3 Mass and weight

Mass: mass is a measure of the quantity of matter in an object at rest relative to the observer

Unit: kilogram (kg) or grams (g)

Measuring device: Electronic balance / beam balance / equal arm balance

Inertia: The ability of an object to resist change in its state of rest or of motion is called inertia. Inertia depends on mass of the object. An object with greater mass has greater inertia and vice versa.

Weight: force with which a body is pulled towards the centre of earth. It is also called Gravitational Force. It is a vector quantity and always acts vertically downwards (towards the center of the earth).

Formula:

$$W = m g$$

Unit: Newton (N)

Measuring device: Force meter (newton meter) / spring balance

Gravitational field: region in which a mass experiences a force due to gravitational attraction
